FOREWORD

The statistics in this publication represent state and county data for the period of 1975 to 1980. Regular Census revisions in state data have been completed and are reflected in the revised data. Data published in the 1978 Census of Agriculture were given primary consideration in establishing revised levels of estimates for the counties. For a few crops, the revisions are rather large at the county level; however, for crops like tobacco and peanuts, no revisions were necessary.

State and county estimates of crops for the years 1972 - 1974 remain as presented in the publication titled *"South Carolina Crop Statistics"*, AE 400. Crop statistics in the following AE publications are superceded: AE 405 and 413.

This Bulletin, prepared by the South Carolina and Livestock Reporting Service is a cooperative effort between the Economics and Statistics Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship helps promote economy and efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in scheduled national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this Bulletin.

The South Carolina Agricultural Experiment Station is a cooperative program financed from federal and state funds. It is the policy of the Experiment Station to comply fully with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S. C. Agricultural Experiment Station, Clemson Univeristy, Clemson, S. C. 29631.

1980 SOUTH CAROLINA CROP SUMMARY

JANUARY: The weather during January averaged cooler and wetter than usual over much of the state, particularly for the central portion. Heavy snow developed over the mountains with lesser amounts in the foothills. There was some flooding in the Midlands on the 19th. Downstream lowland flooding from coastal rivers occurred through most of the month. The 30th and 31st had sleet with freezing rain over northern portions.

Soybean harvest was completed as weather permitted. Classing cotton was soon completed. Farmers were sampling and liming soils along with disking crop residue. Pruning fruit trees and vines was active. Cleaning and banking drainage ditches was necessary. Tobacco plant beds were prepared. Greens were harvested. General maintenance and farm planning helped fill bad weather days.

FEBRUARY: Most areas were cooler and drier than usual during February. A snowstorm on the 6th deposited more than six inches in the mountains and two to five inches elsewhere. Accompanying freezing rain and sleet fell along the north coast. A smaller snowstorm hit the Piedmont and mountains on the 9th. On the 25th, gale-force winds moved through the state causing property damage which was considerable in some places.

Wet and cold weather limited outside activities. Growers harvested winter vegetables. Producers were feeding and caring for livestock. Main outside activities included pruning fruit trees and topdressing pastures and small grains. Wheat conditions were good. Where weather permitted, tobacco and vegetable lands were prepared for spring planting. General maintenance chores and planning was done.

MARCH: Weather was much wetter and colder than usual during March. Snowfall on the 1st and 2nd broke many records along with record-low temperatures on the morning of the 3rd. Most rivers in the Coastal Plains were in flood condition during much of the latter half of the month. General flooding of major rivers developed late in the month. There was scattered frost during the third week.

Much cropland remained wet but disking and applying preplant pesticides and herbicides was done everywhere possible. Tobacco plants seemed good. Much of the south coast's vegetable planting was delayed. By mid-March, southern peaches started budding. Southernmost early tomato planting was hindered by wet soils. By the third week peach blooming started in the south. March concluded with surplus soil moisture and with corn planting only 4 percent finished while looking poor to fair. This was well behind 29 percent last year. Some growers were reducing corn acreages due to the late start. Tobacco was only transplanted in well-drained soils to start. A few plants were nearing oversize. Cotton planting could not be seriously considered.

Peaches were in good condition and blooming in all regions. Slight cold damage was possible but not yet apparent. Ridge growers were having difficulty with scheduling sprays, so overall condition was fair to good.Apples and grapes were in good condition.

Small grain conditions were fair to good. Most nitrogen and herbicide applications had been late or overdue. Pastures and hay crops seemed fair to good.

Statewide, tomatoes were fair to good with March planting at 61 percent, near 1979's pace. Cucumber condition was good but planting was slower than last year. So was snap bean and watermelon planting. Conditions were fair to good for snap beans, poor for watermelons and poor to fair for cantaloups.

APRIL: Flooding persisted through most of April despite weather that was cooler and drier than usual. There were scattered frosts the first week. Scattered wind damage over portions of the state on the 13th included a tornado in the Piedmont. The northeast had hailstorms on the 27th. Excess soil moisture became adequate during the month. Days suitable for outdoor work increased from 1 to 5 by month's end. Wet conditions slowed most planting except for rapid progress near the end of April. Many farmers concerned by the late schedule switched some of their intended corn acreage to alternate crops. Corn condition was fair to good. Planting cotton was delayed well past mid-month while soils remained too cool and wet. Late, rapid planting reached only 43 percent of completion compared to 79 last year. Cotton stands looked fair. Peanut planting was similarly slowed, but the crop looked good. Tobacco plants were getting oversized while cool, wet beds fostered blue mold problems. Transplanting was delayed by wet field conditions.

Small grains looked good except oats were in fair to good condition. Wet, cool weather brought on some wheat mildew and prevented timely topdressing. Wheat was 34 percent headed and oats 41. Peach orchards were sprayed as Piedmont blooming finished. Peaches improved to a good rating while spray programs got on schedule. Scattered Piedmont hail damage remained to be assessed.

Vegetable planting was nearly on schedule except cucurbits lagged behind. Cucumbers' condition was fair since cool nights slowed development. Other vegetables were judged fair to good except tomatoes finally improved to a good rating. Watermelons and cantaloups started out poor to fair. Planting neared usual percentages with improving conditions also aiding development of vines.

MAY: Most areas were cooler than usual with some early May daily low records set in the northwest. Total rainfall averaged above normal over all of the state except for some of the lower Piedmont. Several tornadoes on the 20th caused considerable damage where they touched down. Another tornado struck on the 23rd. Soil moisture steadily approached very short until third week's rain brought estimates of adequate to surplus. Except for the rainy week, 5 or 6 days were suitable for working outdoors. Completion of corn planting was only a little behind usual. Some germination was reduced or delayed due to earlier dry conditions, but the crop was generaly in good condition at month's end. Cotton's fair condition was improved by the rains. Some germination problems resulted in spotty stands, requiring replanting. Some fields had heavy pressure from weeds and grass. Planting peanuts was generally delayed until rain improved soil moisture the third week. Conditions were fair to good although some replanting was indicated. Many soybean growers held up planting until prospects of rain improved. The final week was near-ideal for planting. Planting reached only 57 percent compared to 71 percent in 1979. Many growers were caught up until small grain harvest completion made it possible to follow with soybeans. Stands looked good. Tobacco transplanting completion was hindered by limited plant supplies and was extended past mid-month. May conditions were fair to good as blue mold continued to spread in many fields and budworm threats required control measures.

Peach harvesting in the Ridge began May 19. Earlier wet and cool weather kept peaches and grapes in fair to good condition until welcome rains came. Hail damage was locally severe and a heavy drop was reported for Piedmont peaches. Apple condition was good.

Small grain harvest got underway about a week behind normal as May ended. Dry weather during May reduced yield prospects since much of the crop didn't fill out well during a critical stage of development. Weather was excellent for cutting and curing hay, but stressed pastures. Livestock looked good as producers sprayed to control horn and face flies.

Vegetable harvesting lagged last year. Snap bean condition was fair as late-May harvest gained momentum. Cucumbers looked fair to good and tomatoes, good to excellent.

JUNE: Most of the state was cooler than normal in June with a strong warming trend near the end of the month. Most had below normal rainfall, particularly in the Midlands and lower Piedmont. Severe weather included a tornado on the 8th and a thunderstorm the 12th, causing injury or property damage. Most agricultural areas were needing rain when general rains late in the month brought relief to drouth-stricken crops. Only a few rainy days hindered outdoor work. Corn silked during very poor conditions. Drouth reduced prospects considerably. Although some plantings made recovery, much corn had been damaged beyond recovery. Armyworms, budworms and corn earworms further lowered ratings to fair. Dry conditions were a plus for some of the cotton. Spraying for thrips and other pests continued. Improved soil moisture and warm nights late in June speeded development and squaring above average at 81 percent. Some soybean plantings were made deep enough to reach moisture, but most growers were waiting until rains. Dry stress coupled with thrip or insect pressure caused some defoliation. Planting made progress where showers met moisture requirements, then seeding was held back when general rains made for rather wet conditions. Blue mold on tobacco had become widespread, but subsided with hot, dry condtions. Systemic symptons were met with fungicidal sprays. Weather flecking and stink bugs were damaging. Active irrigation was needed to keep the crop in fair to good condition.

Piedmont orchardists were harvesting Camden peaches as irrigation became necessary to maintain satisfactory fruit size. Small acreages in the Piedmont were damaged by hail but overall rating remained fair to good. Apple thinning progress was good, as was the general condition. Grapes seemed fair to good.

Small grains ripened rapidly during fair to good conditions. Percent harvested caught up to last year's rate before starting to wind down in late June. Wheat and oat early yields were better than had been anticipated. Hay crops and pastures were fair until general rains brought improvement. Harvesting cucumbers started behind usual but was very active under fair conditions. Rains improved later harvested vegetables. As picking got underway, tomatoes were in good or excellent condition. As harvesting passed the halfway mark this month, conditions were judged fair to good. Watermelons matured earlier than usual and included smaller melons due to continued moisture stress.

JULY: Temperatures were well above normal for July with 100 degrees or more commonplace. Showers or thundershowers were too light and scattered to provide general relief for hot, dry conditions. Soil moisture levels reached short or very short. Later July showers in the northwest and along the immediate coast gave regional relief from the drouth.

Early corn in some areas was almost a complete loss due to hot, dry conditions. Some yields were halved while elsewhere a more reasonable prospect was in view. Drouth continued its toll while worm problems increased and weakened stalks resulted in some lodging. The corn crop averaged in poor to fair condition near the end of the month. Cotton had been developing and growing well, but slipped to a fair rating as the drouth deepened. Insect infestations were on the rise in some places and moth activity seemed to be increasing. The crop was wilting in some areas with shedding of young squares and small bolls. Peanut growers were cleaning up weeds and controlling leaf spot. Lesser corn stalk borer damage was worsened by dry conditions. Early planted soybeans that came up with beginning July rains had some ragged stands. There was also weed pressure. Lack of rain seemed to emphasize insect injury to weakened plants. Older plantings in dry regions were shedding lower leaves due to drouth stresses. Only 17 percent of the acreage had any blooms by July 17, about half of normal. Soybean's condition was fair. Tobacco condition was fair to good due to dry stresses as harvesting became widespread the first week. Some of the crop was ripening slower than normal due to stresses. South Carolina-Border Belt markets opened July 28 with harvesting only 20 percent completed compared to 64 a year ago.

Peach, grape and apple conditions slipped to fair to good after mid-month due to the extreme weather. Irrigation was necessary during the peak peach harvest this month. Hot, dry weather generally stressed pastures and hay crops which deteriorated to rate in poor to fair condition. Snap bean and cucumber harvests soon wound down. Coastal tomatoes were about picked by mid-July. Statewide, the crop finished in fair condition. Melon conditions varied with soil moisture but were generally fated fair.

AUGUST: Abnormally hot and dry weather prevailed past mid-August with temperatures often exceeding 100 degrees. Meanwhile, scattered thunderstorms produced substantial amounts of rain in a few spots. These were followed by general showers which provided needed relief from heat. Soil moisture statewide at month's end was very short to short. Row crop deterioration due to drouth was halted in limited areas where showers boosted soil moisture.

Drouth exacted a heavy toll on the corn crop. More of the crop went for silage due to poor conditions during maturing stages. Some areas had virtually no corn for grain. Harvest this month included corn with excess moisture contributing to aflatoxin problems. Percent harvested reached 42, about the same as year ago and average. Abnormal weather stress on cotton caused shedding of bottom leaves and young fruit. Stalk size and bolls were generally small due to poor conditions before bolls opened. Re-growth and re-blooming tempted some producers to attempt to set a late top crop. Spraying increased to combat boll weevil and boll worm numbers. Peanut producers were contending with dry stress and lesser corn stalk borers. Digging was delayed in hopes of more pegs. Soybeans shed some bottom leaves and blooms. About half set pods under extremely adverse conditions. Later showers benefitted lateral growth and setting pods. but stalks were still generally small. Some spots were under heavy insect pressure which required a second spray. The soybean crop condition looked poor to fair. High temperatures affected the tobacco crop as it slowly came off stalks. Soil borne diseases were more prevalent than usual. Harvested quality seemed to gradually improve each week but 84 percent of completion was 14 points behind last year.

Peach sizing problems continued where no irrigation was available but ratings were fair. Harvesting was slower than 1979 and didn't wind up until the last of August. Apple growers were disappointed at fruit size and color. More apples went for juice, including fruit from hail-damaged areas. Grape quality appeared to be good, but tonnage was short.

Damage to pastures was assessed at 70 percent in some regions. Fall armyworm outbreaks really hurt some coastal bermuda, millet and sorghum. In fact, hay was being fed and cattle marketing increased due to poor pastures. Late-month rains restored much green coloration but some pastures appeared to be dead. Hot weather destroyed portions of fall tomatoes just planted. Arrival of rain benefitted fall vegetables but most required irrigation.

SEPTEMBER: Temperatures varied in September but weekly averages were above normal. Soil moisture was rated short to very short through most of September, improving to adequate during the latter part of the month. Over 5 days per week were suitable for field work. Rate of harvest for corn was consistently ahead of 1979. On September 28th, corn was 88 percent harvested and the condition was poor. Cotton development was retarded because of insufficient moisture with very few squares and blooms present. In some areas bolls were opening prematurely due to the dry and hot conditions. Fall armyworms were widespread in some counties. There was defoliation and picking during the first week with plants maturing very rapidly. The condition at that time was rated poor as yields looked to be well below normal. As September ended, picking had progressed at a rapid pace and was a good two weeks ahead of normal. Soybean condition was rated as poor to fair since dry months had adversely affected the crop. Hot, dry weather during the second week deprived the crop of sufficient rainfall for setting and filling out pods. By mid-month much of the crop was at such a critical point that some growers were cutting soybeans for hay to get something of value from their crop. Additional moisture during the third week did little good for the early crop; however, late planted beans should benefit. Scattered showers brought temporary relief to the apple crop during the first week of September. By the second week the crop had improved to fair condition. Picking was 73 percent finished by the latter part of the month compared to 83 a year ago. Grape harvest was far behind the previous year with condition rated fair. Planting of winter grazing started later than usual and was further slowed because of September's inadequate soil moisture. Fall vegetables were in fair condition. Harvesting of fall snap beans and cucumbers got underway by mid-month. Peanuts were in poor to very poor condition with crop deterioration widest by the first week. Some major production areas initiated harvest, viewing discouraging yields. Sweetpotato harvest got off to a fairly good start in most regions by the middle of the month.

OCTOBER: Normal temperatures prevailed during October, briefly dropping below normal temperatures and other periods above normal. The first week of October saw the state's heaviest rainfall since early spring. Overall, the state averaged over 2½ inches of rain during the first three days of the month. Rainfall was scattered for the remainder of the month. Generally, there were 4.5 days suitable for field work each week. By mid-month, virtually all of the short corn crop had been harvested. October was the most active month for harvesting cotton. The month began with 39 percent of the crop harvested and by the end of the month 80 percent had been harvested. Cotton was rated in poor condition the entire month and yields were very low.

By mid-month, harvesting of early maturing soybean varieties had begun. Generally, yields were extremely low due to the growing season's drouth stress. By the end of the month, 11 percent of the soybean crop had been harvested and the crop was rated in poor condition.

The extremely dry weather took its toll on the state's normally hardy peanut crop. Some growers did not even bother to harvest their crop, while others did bale some vines to salvage something of value. The overall condition of the peanut crop was poor for the month. Apple harvesting was virtually complete by the end of the month. The pecan crop was in poor to fair condition for the month. Nut size was smaller than normal due to the dry summer. Harvesting of fall cucumbers continued with the crop rated in fair condition. Supplies were adequate. Snap beans were generally in fair condition during active harvesting. Planting of small grains began this month with increased interest in wheat. Planting progress was slightly delayed where small grains followed soybeans. Small grains were judged in fair to good condition. Sweetpotato harvesting was active but by the month's end, only 70 percent of the crop had been harvested compared to 95 percent this time last year.

NOVEMBER: Rainfall over the state was normal to slightly above for the month. Soil moisture was adequate throughout the month. There were 4 days per week suitable for field activity. Temperatures varied throughout the month, but on the average November was quite normal. Growers generally finished picking cotton by the end of the month. Harvesting progress was slightly ahead of this time last year. Extensive damage was done to the cotton crop by the severe summer drouth, as a result, yields were very low and quality was poor. Soybean harvest continued to lag due to a delayed killing frost and moist conditions. By the end of the month, 51 percent of the crop was harvested compared to 74 percent this time last year. The general condition of the crop was poor for the month with reported yields very low. Some yields were even lower than expected. Some growers chose not to harvest the crop, as the cost of harvesting would be more than the value of the crop.

Pecan condition remained poor to fair for the month. Pecan yields were expected to be well below normal. Fall cucumbers were in fair condition as harvesting was completed this month. Snap bean's condition was poor to fair. Harvesting activities lagged behind last year, but reached completion by mid-month. Peanut harvesting was delayed by moist conditions much of the month, but did manage to be completed by the month's end. Small grain plantings were off to a good start. Growing conditions for small grains were very favorable. Livestock was in fair to good condition.

DECEMBER: Temperatures were well below normal for the entire month. Precipitation was light and also well below normal for the month. Cotton picking was generally complete by the first part of December. Quality and yields of the crop were very low. By the first weekend of the month, only 68 percent of the soybean crop had been harvested, but farmers made rapid progress the remainder of the month, taking advantage of good harvesting conditions. Overall, the crop was in poor condition and low yields were reported. Farmers were very active harvesting their soybeans, so they could continue to plant small grains behind the soybean crop, before it became too late in the season. Growing conditions for small grains were good. Pecan harvesting was in full swing. Farmers were active pruning fruit trees and grape vines. Vegetable and tobacco beds were being fumigated for the coming crop year. Other farming activities included lime applications, soil sampling, caring for livestock and disking land in preparation for spring planting.

1/ Includes corn hogged, grazed, and that cut and fed without removing ears. 2/ Value based on utilized production. 3/ Includes cucumbers for pickles but excludes processing tomatoes and processing snap beans. 4/ Rounded to nearest thousand.

1980 ANNUAL SUMMARY OF SOUTH CAROLINA
VEGETABLES AND MELONS FOR FRESH MARKET AND FOR PROCESSING

Production of the six principle **fresh market** vegetable and melon crops in *SOUTH CAROLINA* in 1980 was 1 percent below the 1979 production.

Value of production for the six major vegetables excluding sweet corn totaled $31,286,000 in 1980 as compared to $31,268,000 in 1979, virtually unchanged.

Production of South Carolina's **cucumbers for pickles** totaled 22,550 tons compared with 26,810 tons in 1979 and 29,650 in 1978.

Conversion factors used to arrive at hundredweight were as follows: 50 lbs. per bag or crate of cabbage, 3.2 lbs. for each cantaloup, 48 lbs. per bu. of cucumbers, 30 lbs. per bu. hamper of snap beans, 30 lbs. per box of tomatoes, and 24.0 lbs. for each watermelon.

VEGETABLES AND MELONS FOR FRESH MARKET AND FOR PROCESSING: ACREAGE, YIELD, PRODUCTION, PRICE PER CWT., AND VALUE OF PRODUCTION, SOUTH CAROLINA, 1979 AND 1980

Crop	Acreage harvested		Yield per acre		Production		Price per cwt.		Value of production	
	1979	1980	1979	1980	1979	1980	1979	1980	1979	1980
	Acres		Cwt.		1,000 Cwt.		Dollars		1,000 Dollars

SOUTH CAROLINA FARM NUMBERS STEADY - UNITED STATES FARMS DECLINE

The number of farms in South Carolina in 1980 is estimated at 35,000, the same as 1979. For 1981, farm numbers are expected to decline about 3 percent to 34,000. Total land in farms was 6.4 million acres for 1980, a decline of 1.5 percent from a year earlier. The preliminary estimate for 1981 land in farms is unchanged from 1980.

The number of farms in the United States in 1980 is estimated at 2,427,830, down slightly from the 2.43 million in 1979. For 1981 farm numbers are expected to decline about 0.4 percent to 2,418,740. Total land in farms was 1,042 million acres for 1980, a decline of 0.1 percent from a year earlier. The preliminary estimate for 1981 is 1,041 million acres, down 0.1 percent from 1980.
